

## Features

- **HIGH-DENSITY PROGRAMMABLE LOGIC**
  - 2000 PLD Gates
  - 32 I/O Pins, Four Dedicated Inputs
  - 96 Registers
  - High-Speed Global Interconnect
  - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
  - Small Logic Block Size for Random Logic
- **HIGH-PERFORMANCE E<sup>2</sup>CMOS<sup>®</sup> TECHNOLOGY**
  - $f_{max} = 125$  MHz Maximum Operating Frequency
  - $t_{pd} = 7.5$  ns Propagation Delay
  - TTL Compatible Inputs and Outputs
  - Electrically Erasable and Reprogrammable
  - Non-Volatile
  - 100% Tested at Time of Manufacture
  - Unused Product Term Shutdown Saves Power
- **IN-SYSTEM PROGRAMMABLE**
  - In-System Programmable (ISP<sup>™</sup>) 5V Only
  - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
  - Reprogram Soldered Device for Faster Prototyping
- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
  - Complete Programmable Device Can Combine Glue Logic and Structured Designs
  - Enhanced Pin Locking Capability
  - Three Dedicated Clock Input Pins
  - Synchronous and Asynchronous Clocks
  - Programmable Output Slew Rate Control to Minimize Switching Noise
  - Flexible Pin Placement
  - Optimized Global Routing Pool Provides Global Interconnectivity
- **ispEXPERT<sup>™</sup> – LOGIC COMPILER AND COMPLETE ISP DEVICE DESIGN SYSTEMS FROM HDL SYNTHESIS THROUGH IN-SYSTEM PROGRAMMING**
  - Superior Quality of Results
  - Tightly Integrated with Leading CAE Vendor Tools
  - Productivity Enhancing Timing Analyzer, Explore Tools, Timing Simulator and ispANALYZER<sup>™</sup>
  - PC and UNIX Platforms

## Functional Block Diagram

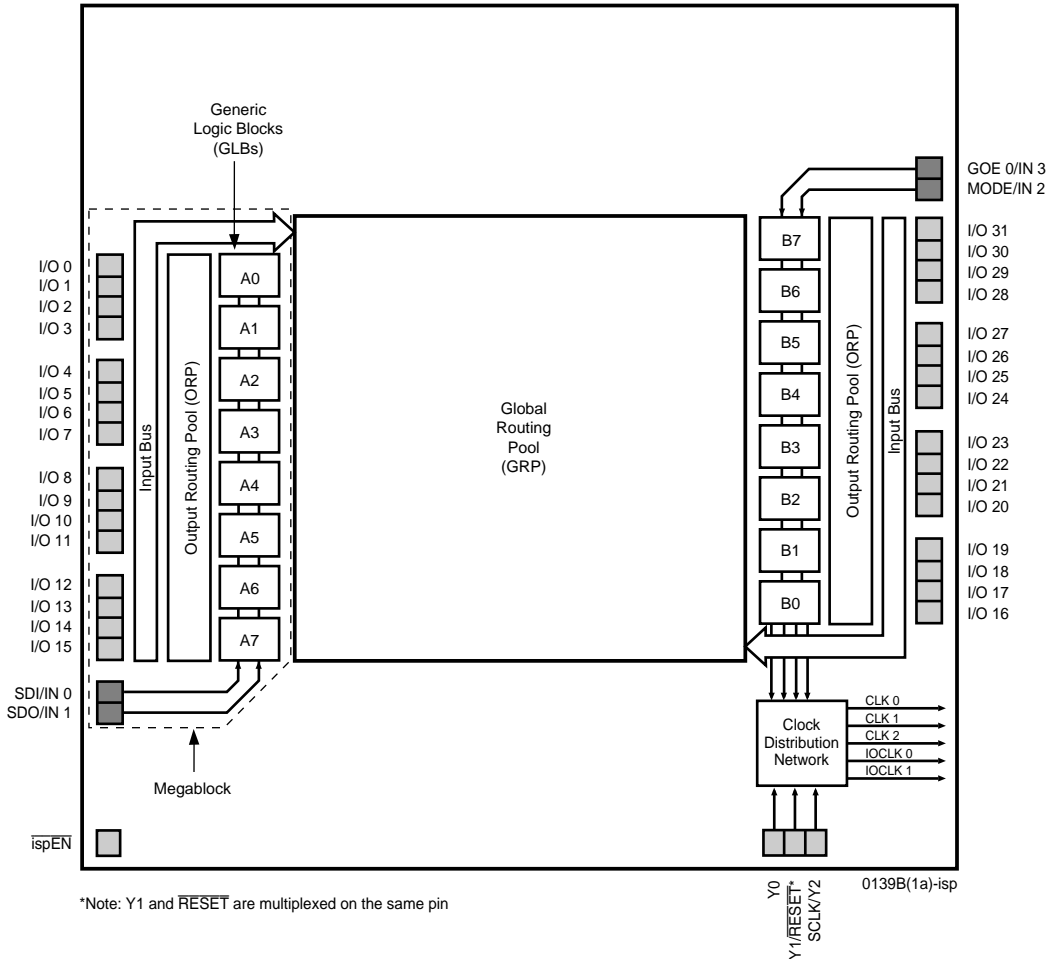

## Description

The ispLSI 1016E is a High Density Programmable Logic Device containing 96 Registers, 32 Universal I/O pins, four Dedicated Input pins, three Dedicated Clock Input pins, one Global OE input pin and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 1016E features 5V in-system programming and in-system diagnostic capabilities. The ispLSI 1016E offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems. A functional superset of the ispLSI 1016 architecture, the ispLSI 1016E device adds a new global output enable pin.

The basic unit of logic on the ispLSI 1016E device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1...B7 (see Figure 1). There are a total of 16 GLBs in the ispLSI 1016E device. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any other GLB on the device.

**Functional Block Diagram**

**Figure 1. ispLSI 1016E Functional Block Diagram**

The device also has 32 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, registered input, latched input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

Eight GLBs, 16 I/O cells, two dedicated inputs and one ORP are connected together to make a Megablock (see Figure 1). The outputs of the eight GLBs are connected to a set of 16 universal I/O cells by the ORP. Each ispLSI 1016E device contains two Megablocks.

The GRP has, as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 1016E device are selected using the Clock Distribution Network. Three dedicated clock pins (Y0, Y1 and Y2) are brought into the distribution network, and five clock outputs (CLK 0, CLK 1, CLK 2, IOCLK 0 and IOCLK 1) are provided to route clocks to the GLBs and I/O cells. The Clock Distribution Network can also be driven from a special clock GLB (B0 on the ispLSI 1016E device). The logic of this GLB allows the user to create an internal clock from a combination of internal signals within the device.

## Absolute Maximum Ratings <sup>1</sup>

Supply Voltage  $V_{CC}$  ..... -0.5 to +7.0V  
 Input Voltage Applied ..... -2.5 to  $V_{CC} + 1.0V$   
 Off-State Output Voltage Applied ..... -2.5 to  $V_{CC} + 1.0V$   
 Storage Temperature ..... -65 to 150°C  
 Case Temp. with Power Applied ..... -55 to 125°C  
 Max. Junction Temp. ( $T_J$ ) with Power Applied ... 150°C

1. Stresses above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

## DC Recommended Operating Conditions

| SYMBOL   | PARAMETER          | MIN.                                                        | MAX.         | UNITS |   |
|----------|--------------------|-------------------------------------------------------------|--------------|-------|---|

Table 2-0007/1016E

- One output at a time for a maximum duration of one second.  $V_{OUT} = 0.5V$  was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
- Measured using four 16-bit counters.
- Typical values are at  $V_{CC} = 5V$  and  $T_A = 25^\circ C$ .
- Maximum  $I_{CC}$  varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum  $I_{CC}$ .

 \end{aligned}$$

Table 2-0042-16

1. Calculations are based upon timing specifications for the ispLSI 1016E-125

**Maximum GRP Delay vs GLB Loads**

**Power Consumption**

Power consumption in the ispLSI 1016E device depends on two primary factors: the speed at which the device is operating and the number of Product Terms used.

Figure 3 shows the relationship between power and operating speed.

**Figure 3. Typical Device Power Consumption vs fmax**

Notes: Configuration of four 16-bit counters  
Typical current at 5V, 25°C

ICC can be estimated for the ispLSI 1016E using the following equation:

$$I_{CC}(mA) = 23 + (\# \text{ of PTs} * 0.52) + (\# \text{ of nets} * \text{max freq} * 0.004)$$

Where:

- # of PTs = Number of product terms used in design
- # of nets = Number of signals used in device
- Max freq = Highest clock frequency to the device (in MHz)

The ICC estimate is based on typical conditions (VCC = 5.0V, room temperature) and an assumption of four GLB loads on average exists and the device is filled with four 16-bit counters. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual ICC should be verified.

## Pin Description

| NAME                                                                                                                                            | PLCC<br>PIN NUMBERS                                                                                                                          | TQFP<br>PIN NUMBERS                                                                                                                            | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                          |
